GROUT PACKER

The Grout Packer is designed to be used in rock or stone for injecting grout or de-watering of the strata.

Once a hole has been drilled into the rock strata the packer can be inserted.

The rubber end locks onto the inner wall of the hole in the strata when the handle has been turned sufficiently tight.

The rubber forms a seal in the hole allowing fluid to be passed either way through the centre of the packer via the snap coupling.

APPLICATIONS

- ✓ Grout Injection
- ✓ De-watering of strata
- ✓ Slab jacking
- ✓ Gas drainage

VARIOUS SIZES AVAILABLE

- Hole bore $\varnothing 35$ to $\varnothing 110$ mm
- Lengths from 0.5m
- Supplied with ball valve and snap coupling
- Special sizes upon request
